Sun OC48 Packet Over Sonet Adapter Release Notes

The *Sun OC48 Packet Over Sonet Adapter Release Notes* provides information to help with troubleshooting common problems you might encounter.

Troubleshooting

1. PPP state change when application is running.

When pppd is stopped and re-started when any application is running on the link, the link will not go back up until after waiting for a substantial amount of time. Perform arp -d manually after this situation occurs.

2. Using ifconfig down when pppd is running.

The command, if config down, can leave pppd running. Kill pppd manually when this happens.

3. IPMP is not supported when pppd is used.

IPMP does not work for ppp if the link is configured using pppd. Use ifconfig to plumb and unplumb the PPP link if IPMP is used.

4. Sun OC48 PacketOverSonet adapter has been tested on the SunFire 880 and the SunFire 48xx / 68xx series of server platforms only. It has not yet been tested on other SunFire platform such as the 15K series.
